

SECURITY & COMPLIANCE

IT SECURITY AS A SERVICE

Proper IT hygiene demands a comprehensive approach, built on a foundation of in-depth discovery and gap analysis. Instead of being two steps behind with costly in-house tools and resources, leverage Atomic Data's IT Security as a Service to step up your IT hygiene.

Discovery

Give us 5 to 10 hours to review your data footprint, governance requirements, Software as a Service (SaaS) and cloud usage, existing practices, personnel and more. Once a baseline is set we'll produce customized recommendations to get you in compliance and lockdown your data.

Data & Asset Mapping & Analysis

We'll map out where your data is housed and by whom, then inventory everything in, on, and around your network. From there we provide best-practice recommendations, network diagrams, estimates & more.

Policies & Procedures

Our certified experts employ a four-step process to advise organizations on their policies, including Analysis, Recommendations, Remediation, and an Annual Review.

Patch Management

Mitigate risk and maintain compliance with automated, managed patching for Windows and Linux-based servers and workstations.

Intrusion Prevention & Managed Firewall

Detects, blocks, and remediates network intrusion events using fully-managed enterprise-grade Cisco® firewalls and Intrusion Prevention.

Cisco® Umbrella® DNS Filtering

Block malware, phishing, and command & control callbacks over any port or protocol--before threats reach your users, no matter where they work.

Security Awareness Training

You'll rest easier knowing that your staff are less prone to preventable and costly missteps. Delivered in-person or remotely, topics range from general principles to social engineering, phishing simulations to defense in depth tactics.
